Inefficient teachers overlook the potential power of the opening minutes of class.

(A) If you are prepared for class and have taught your students an opening routine, they can use this brief time to make mental and emotional transitions from the last class or subject and prepare to focus on learning new material. In summary, you should establish an opening routine to develop your class with an effective start.

(B) You can either use the first ten minutes to start your class well or let this time go to waste. The first minutes set the tone for the rest of the class.

(C) Often, if students are quiet enough and if there are many pressing demands on a teacher's time at that moment, more than ten minutes can disappear before class starts. It's no wonder that students are late for class; they have little reason to be on time.

① (A) - (C) - (B) ② (B) - (A) - (C) ③ (B) - (C) - (A)
④ (C) - (A) - (B) ⑤ (C) - (B) - (A)

Many atoms in your body are nearly as old as the universe itself. When you breathe, for example, only some of the atoms that you inhale are exhaled in your next breath. The remaining atoms are taken into your body to become part of you, and they later leave your body by various means. You don't "own" the atoms that make up your body; you borrow them. We all _____ because atoms forever travel around, within, and among us. Atoms cycle from person to person as we breathe and as our sweat is evaporated. We recycle atoms on a grand scale. The origin of the lightest atoms goes back to the origin of the universe, and most heavier atoms are older than the Sun and Earth. There are atoms in your body that have existed since the first moments of time, recycling throughout the universe among limitless forms, both nonliving and living. You're the present caretaker of the atoms in your body. There will be many who will follow you.

*evaporate: 증발시키다

① keep our own atoms for life
② share from the same atom pool
③ create new atoms when we breathe
④ lose most of our atoms while we sleep
⑤ stay away from atoms in nature

3 다음 빈칸에 들어갈 말로 가장 적절한 것은?

The act of gardening itself is a fantastic form of physical activity. It involves a range of motions, from digging and planting to watering and harvesting. These activities help improve strength, flexibility, and endurance. You might not realize it, but small tasks like weeding or turning compost can burn many calories. Gardening is particularly beneficial for those who find traditional exercise challenging. It's _____, making it accessible for people of all ages and physical abilities. Besides physical health, gardening has profound mental health benefits. Looking after plants can be extremely calming and relaxing. It allows you to focus on the present moment, reducing stress and anxiety. The repetitive tasks involved in gardening can induce a state of mindfulness, similar to meditation. Studies have shown that spending time in nature, even in a small garden, can elevate mood, improve cognition, and reduce depression symptoms. The sense of accomplishment from watching your plants grow and thrive can also boost self-esteem and overall well-being.

*compost: 퇴비

① a hard activity only for young and strong people
② an expensive hobby that needs special tools
③ a quick way to grow food for the whole family
④ a low-impact way to stay active and fit
⑤ a kind of exercise that causes stress and anxiety

4 다음 빈칸에 들어갈 말로 가장 적절한 것은?

For many centuries, humans have taken advantage of tools that translate and bring into our perception natural phenomena that we can't perceive with our senses. In some cases, this consists of simply amplifying signals that feed into our normal sensory inputs (e.g., telescopes can bring into clear view that which is too far away for our eyes to perceive on their own). Other instruments change signals that we cannot perceive into signals that we can observe. Some of these take the form of expanding the reach of our current senses, such as creating visible images based on the ultraviolet spectrum of light or changing sounds that are normally outside the range of what human ears can hear into audible signals. Alternatively, some instruments _____ and change them into that which we can observe.

*amplify: 확장하다 **audible: 들을 수 있는

① measure properties for which we have no sensory capacity at all
② make our eyes see farther without any help
③ block signals that are too strong for our ears
④ turn visible images back into sounds
⑤ replace our senses with new natural phenomena

Many opponents of animal experimentation argue that not only is modern medicine not the only cause for the decline in mortality, many medical advances that ① did contribute to human health were not the result of animal experimentation. Defenders of research have claimed that since there is a strong correlation between the practice of animal experimentation and medical advancement, the former ② caused the latter. Opponents of research reject this inference. **(A)** _____, we have independent reasons to expect these phenomena to be correlated. Since the law prescribes that all new drugs, prosthetic devices, and surgical techniques ③ be tried on animals before they are used in humans, we will subsequently find that all medical advances are correlated with prior experimentation on animals. **(B)** _____, the correlation between animal experimentation and medical discovery is the result of legal necessity, not evidence that animal experimentation led to medical advances. Moreover, several influential physicians have offered historical evidence that animal experimentation ④ have not been as responsible for biomedical discovery as defenders suggest. They claim that clinical discoveries played a more substantial role than animal researchers have led us ⑤ to believe.

If put into an enclosure, they are likely to panic, and either die of shock or hit themselves repeatedly to death against the fence in their attempts to escape.

Large plant-eating mammals react in different ways to danger from predators or humans. (①) Some species are nervous, fast, and programmed for instant flight when they perceive a threat. (②) Other species are slower, less nervous, seek protection in herds, stand their ground when threatened, and don't run until necessary. (③) Naturally, the nervous species are difficult to keep in captivity. (④) That's true, for example, of gazelles, which for thousands of years were the most frequently hunted game species in some parts of the Fertile Crescent. **(가)** 그 지역의 최초 정착민들에게 가젤보다 길들일 기회가 더 많았던 포유류 종은 없었다. (⑤) But no gazelle species has ever been domesticated. Just imagine trying to herd an animal that runs away, blindly hits itself against walls, can leap up to nearly 30 feet, and can run at a speed of 50 miles per hour!

**herd: 무리

For a species born in a time when resources were ① limited and dangers were great, our natural tendency to share and cooperate is complicated when resources are plenty and outside dangers are few. When we have less, we tend to be more open to sharing what we have. Certain nomadic tribes don't have much, yet they are happy to share because it is in their ② interest to do so. If you meet them on your travels, they will open their homes to you and offer you their food and hospitality. It's not just because they are nice people; it's because their ③ survival depends on sharing, for they know that they may be the travelers in need of food and shelter another day. Ironically, the more we have, the bigger our fences, the more sophisticated our security to keep people away and the ④ less we want to share. Our desire for more, combined with our reduced physical interaction with the "common folk," starts to create a ⑤ connection or blindness to reality.

*nomadic: 유목의 **hospitality: 환대

Our happiness or sadness is not decided only by each separate moment of life experience—a good thing happens and I'm happy, a bad thing happens and I'm sad. While our experiences affect our mood, we are not blown in a completely new direction by each gust of wind. As humans, we adjust—to new information and events both good and bad—and return to our personal default level of well-being. There will be highs and lows, but over time, like water seeking **(a)** its own level, we are pulled toward our baseline—back up after bad news and back down after good. The euphoria of first love fades, and so does the despair of a break-up. This tendency is best seen with little kids and **(b)** their toy joy: When **(c)** they get what they've longed for, **(d)** they believe they will be happy for the rest of their lives. And for the first few minutes of the rest of their lives, **(e)** they are. But then the kids—like adults—adapt.

*euphoria: (극도의) 행복감

Although you may put off going to sleep in order to squeeze more activities into your day, eventually your need for sleep becomes overwhelming and you are forced to get some sleep. This daily need for sleep seems to come partly from a compound known as adenosine.

(A) Because of such built-in molecular feedback, you can't become accustomed to getting less sleep than your body needs. Eventually, a lack of sleep catches up with you.

(B) This natural chemical builds up in your blood as time awake increases. While you sleep, your body breaks down the adenosine. Thus, this molecule may be what your body uses to keep track of lost sleep and to trigger sleep when needed.

(C) An accumulation of adenosine and other factors might explain why, after several nights of less than optimal amounts of sleep, you build up a sleep debt that you must make up by sleeping longer than normal.

However, if the next digit is uncertain, that means the uncertainty in knowing the precise Earth-sun distance is larger than the distance between New York and Chicago!

One of the things that makes uncertainty difficult for members of the public to appreciate is that the significance of uncertainty is relative. (①) Take, for example, the distance between Earth and the sun: 1.49597×10^8 km, as measured at one point during the year. (②) This seems relatively precise; after all, using six significant digits means I know the distance to an accuracy of one part in a million or so. (③) Whether or not the quoted number is "precise" therefore depends on what I'm intending to do with it. (④) If I care only about what minute the sun will rise tomorrow, then the number quoted here is fine. (⑤) If I want to send a satellite to orbit just above the sun, however, then I would need to know distances more accurately.

*significant digit: 유효 숫자

[13~14] 다음 글을 읽고, 물음에 답하시오.

Richard Heinberg, an American journalist, argues that in building the renewable energy infrastructure to stop global warming, we are actually involved in one of the ① greatest change projects in human history. In addition to solar panels and wind turbines, we have to build an ② alternative transport infrastructure, farming procedures and industrial processes. This transformation cannot happen ③ without fossil fuels. For example, making concrete structures and steel parts needs a lot of energy that can only be produced with fossil energy. Production of solar panels requires ④ scarce and expensive minerals which must be excavated, again requiring the use of fossil fuels. Thus, the ⑤ more slowly we push towards a renewable energy system, the faster we have to use fossil energy for the construction process. This is not only expensive, but also an undermining factor for our efforts to cut global emissions. Heinberg remarks that the cost of building this new energy infrastructure is seldom counted in transition proposals, which tend to focus just on energy supply requirements.

Humans for centuries have dreamed of machines that could become intelligent and make human-like decisions. ① There have been myths about robots, automatons, and artificial beings since ancient Greece (e.g., the myth of Pandora, who released ills upon the world). ② Today, many people use smartphones to take pictures and send messages. ③ Likewise, literature throughout history has dreamed of creating human-like creatures and thinking machines (e.g., Mary Shelley's Frankenstein). ④ In 1950, British mathematician Alan Turing asked whether machines could think and reason like humans and then developed the Turing test to measure a machine's intelligence and whether the machines can think autonomously. ⑤ A few years later, MIT professor John McCarthy came up with the term "artificial intelligence" to replace the older expression "automata studies." Since then, artificial intelligence has become the study and practice of "making intelligent machines" that are programmed to think like humans—endowed by their creators with reasoning and learning.

*automaton: 자동 장치 **endow: 부여하다

The desert tortoise has a simple solution for coping with Death Valley's extreme heat: It avoids it. The slow-moving creature hibernates during the winter and stays in its tunnel for much of the summer, meaning that it spends more than 90 percent of its life immobile. In fact, the tortoise usually comes out only after a good rain. Then, it gets to work. The tortoise stocks up on water by eating plants and digging holes to collect rain. But to stay supplied with water through its extended hibernation, the reptile relies on something else—its highly sophisticated bladder. Unlike most animals, the tortoise's bladder acts as a holding tank, allowing it to reabsorb water back into its body. Incredibly, a desert tortoise can go a full year without taking in any freshwater at all. And because its bladder is so important to a tortoise's survival, park rangers often remind visitors not to stop and help the slow-movers across the road. Tortoises get so frightened when people lift them that they empty their bladders and lose their precious water.

*hibernation: 동면 **bladder: 방광

[18~19] 다음 글을 읽고, 물음에 답하시오.

Picture yourself pedalling your bicycle on a flat road. You stop pedalling: no force is now acting to move you forward. What happens? You gradually slow down. How could you slow down more suddenly, in a shorter distance? By putting the brakes on. Because the brakes change your movement, making you slow down more suddenly, they must be exerting a force on the bicycle and you, as they grip and rub on the wheel-rims. This is the force called friction, which tends to slow down moving things by acting in the direction opposite to movement, that is backwards. Even without the brakes on, there are other friction forces acting on you and your bicycle, which also slow you down. One of these is friction in the wheels rubbing on the axles. Another is air resistance, which you can feel, pushing you backwards as you and the bicycle move forwards. When you apply these ideas to something around you, like a cart, you can see what could be generating friction: mainly the axles rubbing on the body as they rotate.

*axle: (바퀴의) 축 **rim: 테두리

18 윗글의 주제로 가장 적절한 것은?

① Air resistance helps bicycles move forward more easily.
② Brakes work best when the road is not level.
③ Pedalling harder is the only way to stop a bicycle quickly.
④ Friction acts against movement and slows down moving things.
⑤ Carts move faster than bicycles because of their axles.

19 윗글의 내용과 일치하는 것은?

① 페달 밟기를 멈추면 자전거는 그 자리에서 즉시 멈춘다.
② 브레이크는 바퀴 테두리를 잡고 문질러 자전거에 힘을 가한다.
③ 마찰력은 움직임과 같은 방향으로 작용한다.
④ 브레이크를 잡지 않으면 자전거에는 어떤 마찰력도 작용하지 않는다.
⑤ 공기 저항은 자전거를 앞으로 밀어 준다.

All editing systems are now nonlinear computer-based systems that allow random access to any video shot or scene without having to fast forward or fast reverse to find it. Nonlinear systems can produce many special effects, such as slow motion, wipes and dissolves. Another highlight of a digital nonlinear system is its random access process that makes it easy for an editor to find desired shots or scenes without having to spend time fast forwarding or rewinding videotape. With nonlinear editing, you can easily add or remove shots or scenes anywhere in the program, and the computer adjusts the program length automatically. Linear editing was like composing a paper on a typewriter. If a mistake was made or new information needed to be added the whole piece had to be retyped. Nonlinear editing, on the other hand, is like _____. If a mistake is made, it is easily deleted and fixed with a few keystrokes, and new information can be added easily.

*linear: 선형의

① composing a paper on a typewriter
② watching a movie in slow motion
③ using a word processing program
④ writing a letter by hand with a pen
⑤ rewinding a videotape to find a scene

21 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

A morally good person is someone who does morally bad things much less often, and morally good things much more often, than most people. In judging a person not only her actions but also her intentions and motives ① <u>are</u> relevant. A morally good person must intend to do morally good actions and intend to avoid morally bad ones. A person who unintentionally prevents harm to others and ② <u>does not harm</u> them simply because things do not turn out as she intends is not morally good. Although this kind of situation generally occurs only in slapstick movies, it is worth ③ <u>to mention</u> to avoid the false impression that it is the actual consequences of a person's actions that count toward her being judged morally good or bad. But actual consequences are important. A person who always tries to prevent harm but never does, is not generally ④ <u>thought</u> of as morally good. Of such a person, it may be said that she means well; but, contrary to Kant, some results are necessary before she ⑤ <u>is regarded</u> as morally good.

① ② ③ ④ ⑤

22 밑줄 친 <u>serve them up to us with a mechanical indifference</u>가 다음 글에서 의미하는 바로 가장 적절한 것은?

Vision is influenced by our preconceptions about reality. In viewing a scene, we establish unconscious hierarchies that reflect our functional relationship to objects and our momentary priorities. For example, when visualizing a hammer in our mind's eye, we tend to "see" it in profile or at some other "ready for use" angle. One would probably not picture a hammer from the top, with its handle hidden by its head. The functional relationship we have with objects creates visual expectations that interfere with our ability to see "like a camera." The camera, like the human eye, sees only shapes and colors. Through a lens similar to the eye, it records the world without bias. When we look at them carefully, photographs are often surprising because they don't interpret confusing details but simply <u>serve them up to us with a mechanical indifference</u>. And because of their flatness, photographs often contain areas that appear as unrecognizable colors and shapes.

① present details as they are without judging what matters
② make confusing details clearer for the viewer
③ hide unimportant objects from our eyes
④ show us only the objects we expect to see
⑤ add emotional colors to ordinary scenes

23 다음 글의 요지로 가장 적절한 것은?

"May I help you?" is the worst question a retail salesperson can ask because it does not encourage customers to talk and puts them on the defensive. The four words usually draw out a negative response that **(a)** stops cold a sales transaction. Examples of better questions to use when approaching customers are "Is there anything in particular that you are **(b)** look for?" and "Are you shopping for a gift?" If a fashion salesperson approached you with "May I help you?" chances are you would feel the salesperson didn't care. This line is a rote approach that is so overused by untrained and uninterested salespeople. In fact, most of us **(c)** shudder in horror on hearing these words. The very meaning of the question "May I help you?" implies that the customer is in trouble of some sort and needs rescuing. This almost always puts the customer on the defense. "No, thank you" is usually the immediate response, even if the customer is actually in need of assistance. The subconscious thought by the customer is often "I'm smart enough **(d)** to figure out what I want, and I don't need your help!"

If customers feel pressured or cornered, then salespeople won't make any sales. The approach has to promote a comfortable environment that makes customers feel there is no rush. Also, if customers simply want to look around, they should feel free to do so. In situations **(e)** which customers really do want to look around on their own, salespeople should give customers their business cards and keep themselves accessible in case customers have questions or concerns.

*shudder: 몸서리치다

① Customers usually enjoy being asked many questions by salespeople.
② Instead of asking "May I help you?", salespeople should let customers shop without feeling pressured.
③ Fashion salespeople should follow customers around the store.
④ Stores should hire more salespeople to give out business cards.
⑤ Customers who say "No, thank you" rarely need any help.
