Teachers who are not efficient fail to see how powerful the first minutes of class can be. Often, if students are quiet enough and if there are many pressing demands on a teacher's time at that moment, more than ten minutes can disappear before class starts. It's no wonder that students are late for class; they have little reason to be on time. You can use the first ten minutes to get your class off to a great start, or you can choose to waste this time. The first minutes set the tone for the rest of the class. If you are prepared for class and have taught your students an opening routine, they can use this brief time to make mental and emotional transitions from the last class or subject and prepare to focus on learning new material. In summary, you should set up a starting routine so that your class can begin well.

① Busy teachers need more time to prepare for a new subject.
② Students who come late often miss the most important part of a lesson.
③ A routine at the start of class helps the whole lesson go well.
④ A quiet classroom is the first step to better test scores.
⑤ Teachers should cut the first ten minutes out of every class.

Many atoms in your body are nearly as old as the universe itself. When you breathe, for example, only some of the atoms that you inhale are exhaled in your next breath. The remaining atoms are taken into your body to become part of you, and they later leave your body by various means. The atoms that make up your body are not yours to keep; you only borrow them. We all share from the same atom pool because atoms forever travel around, within, and among us. Atoms cycle from person to person as we breathe and as our sweat is evaporated. We recycle atoms on a grand scale. The origin of the lightest atoms goes back to the origin of the universe, and most heavier atoms are older than the Sun and Earth. There are atoms in your body that have existed since the first moments of time, recycling throughout the universe among limitless forms, both nonliving and living. For now, you are the one who takes care of the atoms in your body. There will be many who will follow you.

* evaporate: 증발시키다

① The atoms in your body are only borrowed and keep moving among all things.
② Our bodies make new atoms every time we breathe in and out.
③ Only the lightest atoms in our bodies are passed on to other people.
④ Heavier atoms leave the body faster than the lightest atoms do.
⑤ Taking good care of the body is the best way to keep its atoms healthy.

Gardening itself is a great kind of physical activity. It involves a range of motions, from digging and planting to watering and harvesting. These activities help ①improve strength, flexibility, and endurance. You might not realize it, but small tasks like weeding or turning compost ②can burn many calories. Gardening is particularly beneficial for ③those who find traditional exercise challenging. It's a low-impact way to stay active and fit, ④making it accessible for people of all ages and physical abilities. Along with physical health, gardening also brings great mental health benefits. Tending to plants can be incredibly calming and meditative. It allows you to focus on the present moment, ⑤reduce stress and anxiety. The repetitive tasks involved in gardening can induce a state of mindfulness, similar to meditation. Studies have shown that spending time in nature, even in a small garden, can elevate mood, improve cognition, and reduce depression symptoms. The sense of accomplishment from watching your plants grow and thrive can also boost self-esteem and overall well-being.

* compost: 퇴비

For a long time, people have used tools that turn natural events we cannot sense into things we can perceive. In some cases, this consists of simply amplifying signals that feed into our normal sensory inputs (e.g., telescopes can bring into clear view that which is too far away for our eyes to perceive on their own). Other instruments turn signals that we cannot perceive into ones that we can observe. Some of these take the form of expanding the reach of our current senses, such as creating visible images based on the ultraviolet spectrum of light or changing sounds that are normally outside the range of what human ears can hear into audible signals. Alternatively, some instruments measure properties for which we have no sensory capacity at all and change them into that which we can observe.

* amplifying: 확장하다(amplify) audible: 들을 수 있는

① Light and sound are the only things that humans cannot perceive.
② Our senses are strong enough to notice most natural events without any tools.
③ Telescopes were the first tool that changed what humans can hear.
④ People have long used tools to make what we cannot sense into something we can perceive.
⑤ People should stop relying on tools to understand the natural world.

8 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은?

Many people who oppose animal experimentation say that modern medicine is not the only reason deaths have gone down, and many medical advances that helped human health did not come from animal experimentation. Defenders of research have claimed that since there is a strong correlation between the practice of animal experimentation and medical advancement, the former caused the latter. Opponents of research reject this inference. After all, we have independent reasons to expect these phenomena to be correlated. Since the law prescribes that all new drugs, prosthetic devices, and surgical techniques be tried on animals before they are used in humans, we will subsequently find that all medical advances are correlated with prior experimentation on animals. Consequently, the correlation between animal experimentation and medical discovery is the result of legal necessity, not evidence that animal experimentation _____. Moreover, several influential physicians have offered historical evidence that animal experimentation has not been as responsible for biomedical discovery as defenders suggest. They claim that clinical discoveries played a more substantial role than animal researchers have led us to believe.

* prosthetic: 보철의

① stopped new drugs from being used
② was needed by doctors
③ was tried on humans first
④ was done by the law
⑤ led to medical advances

Big mammalian herbivore species show different reactions when predators or humans put them in danger. Some species are nervous and fast, and they are built to run away at once when they sense a threat. Other species are slower, less nervous, seek protection in herds, stand their ground when threatened, and don't run until necessary. Naturally, the nervous species are difficult to keep in captivity. If put into an enclosure, they are likely to panic, and either die of shock or hit themselves repeatedly to death against the fence in their attempts to escape. That's true, for example, of gazelles, which for thousands of years were the most frequently hunted game species in some parts of the Fertile Crescent. There is no mammal species that the first settled peoples of that area had more opportunity to domesticate than gazelles. But no gazelle species has ever been domesticated. Just imagine trying to herd an animal that runs away, blindly hits itself against walls, can leap up to nearly 30 feet, and can run at a speed of 50 miles per hour!

* herbivore: 초식동물 herd: 무리

① Animals that stay in herds are more dangerous to humans than fast ones.
② Hunting gazelles for thousands of years made them run faster.
③ Animals that panic easily are hard to keep, as the gazelle shows.
④ Humans have always kept the animals that are easy to catch.
⑤ Higher fences are the best way to keep big herbivores safe.

12 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은?

Different big herbivores respond in their own ways to danger from predators or humans. Some species are ① nervous, fast, and programmed for instant flight when they perceive a threat. Other species are slower, less nervous, seek protection in herds, stand their ground when threatened, and don't run until necessary. Naturally, the nervous species are ②difficult to keep in captivity. If put into an enclosure, they are likely to ③ panic, and either die of shock or hit themselves repeatedly to death against the fence in their attempts to escape. Humans were born in a time of few resources and great dangers, so our natural tendency to share and cooperate becomes complicated when resources are plenty and dangers are few. When we have less, we tend to be more open to sharing what we have. Certain nomadic tribes don't have much, yet they are happy to share because it is in their interest to do so. If you happen upon them in your travels, they will open up their homes and give you their food and hospitality. It's not just because they are nice people; it's because their survival depends on sharing, for they know that they may be the travelers in need of food and shelter another day. Ironically, the more we have, the bigger our fences become and the better our security gets at keeping people away, and the less we want to share. Our desire for more, combined with our decreased physical interaction with the "common folk," starts to create a disconnection or blindness to reality.

* nomadic: 유목의 hospitality: 환대

People tend to share more when they have ——(A)——, but as they gain more, they become ——(B)—— willing to share.

	(A)	(B)
①	little	more
②	little	less
③	much	more
④	safety	less
⑤	much	less

14 다음 글의 제목으로 가장 적절한 것은?

②	adapt	limit
③	adapt	level
④	move	limit
⑤	ignore	level

17 다음 글의 제목으로 가장 적절한 것은?

Although you may put off going to sleep in order to squeeze more activities into your day, eventually your need for sleep becomes overwhelming and you are forced to get some sleep. This daily drive for sleep appears to be due, in part, to a compound known as adenosine. This natural chemical builds up in your blood as time awake increases. While you sleep, your body breaks down the adenosine. Thus, this molecule may be what your body uses to keep track of lost sleep and to trigger sleep when needed. An accumulation of adenosine and other factors might explain why, after several nights of less than optimal amounts of sleep, you build up a sleep debt that you must make up by sleeping longer than normal. Because of such built-in molecular feedback, you can't become accustomed to getting less sleep than your body needs. In the end, you will always have to pay for the sleep you miss.

* compound: 화합물 accumulation: 축적

① Your body keeps track of lost sleep, so you cannot escape your need for it.
② Adenosine in your blood helps you stay awake for many more hours at night.
③ Putting off sleep lets your body get used to needing less of it.
④ Sleeping longer than normal is the best way to build up adenosine.
⑤ Squeezing more activities into your day makes you sleep better at night.

One thing that makes uncertainty hard for ordinary people to understand is that how much it matters is relative. Take, for example, the distance between Earth and the sun: 1.49597×10^8 km, as measured at one point during the year. This seems relatively precise; after all, using six significant digits means I know the distance to an accuracy of one part in a million or so. ____(A)____, if the next digit is uncertain, that means the uncertainty in knowing the precise Earth-sun distance is larger than the distance between New York and Chicago! ____(B)____, whether or not the quoted number is "precise" depends on what I'm intending to do with it. If I care only about what minute the sun will rise tomorrow, then the number quoted here is fine. If I want to send a satellite to orbit just above the sun, however, then I would need to know distances more accurately.

* significant digit: 유효 숫자

	(A)	(B)
①	However	Therefore
②	Similarly	Therefore
③	However	In contrast
④	For instance	In contrast
⑤	Therefore	However

20 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은?

One of the things that makes uncertainty ① difficult for members of the public to appreciate is that the significance of uncertainty is relative. Take, for example, the distance between Earth and the sun: 1.49597×10^8 km, as measured at one point during the year. This seems relatively ② precise; after all, using six significant digits means I know the distance to an accuracy of one part in a million or so. However, if the next digit is uncertain, that means the uncertainty in knowing the precise Earth-sun distance is ③ larger than the distance between New York and Chicago! So whether the quoted number counts as "precise" depends on what I plan to do with it. If I care only about what minute the sun will rise tomorrow, then the number quoted here is ④ useless. If I want to send a satellite to orbit just above the sun, however, then I would need to know distances more ⑤ accurately.

* significant digit: 유효 숫자

21 다음 글의 요지로 가장 적절한 것은?

Richard Heinberg, an American journalist, argues that in building the renewable energy infrastructure to stop global warming, we are actually involved in one of the greatest change projects in human history. In addition to solar panels and wind turbines, we have to build an alternative transport infrastructure, farming procedures and industrial processes. Building a renewable energy system is not possible without fossil fuels. For instance, production of concrete structures and steel elements require amounts of energy that is only possible to produce with fossil energy. Production of solar panels requires scarce and expensive minerals which must be excavated, again requiring the use of fossil fuels. Thus, the more strongly we push for renewable energy, the more quickly we need to use fossil energy for building it. This is not only expensive, but also an undermining factor for our efforts to cut global emissions. Heinberg remarks that the cost of building this new energy infrastructure is seldom counted in transition proposals, which tend to focus just on energy supply requirements.

* excavate: 발굴하다

① Solar panels and wind turbines are too expensive for most countries to buy.
② Cutting global emissions is easy if we build more concrete and steel structures.
③ Transition proposals should count the cost of energy supply in every report.
④ Building a renewable energy system actually requires a large use of fossil energy.
⑤ Fossil fuels should be banned at once so that solar panels can be built faster.

22 다음 글의 내용을 한 문장으로 요약하고자 한다. 빈칸 (A), (B)에 들어갈 말로 가장 적절한 것은?

Richard Heinberg, an American journalist, argues that in building the renewable energy infrastructure to stop global warming, we are actually involved in one of the greatest change projects in human history. In addition to solar panels and wind turbines, we have to build an alternative transport infrastructure, farming procedures and industrial processes. This transformation cannot happen without fossil fuels. For instance, production of concrete structures and steel elements require amounts of energy that is only possible to produce with fossil energy. Production of solar panels requires scarce and expensive minerals which must be excavated, again requiring the use of fossil fuels. Therefore, the more we try to move toward renewable energy, the more fossil fuel we need while we build it. This is not only expensive, but also an undermining factor for our efforts to cut global emissions. Heinberg remarks that the cost of building this new energy infrastructure is seldom counted in transition proposals, which tend to focus just on energy supply requirements.

* excavate: 발굴하다

Building a renewable energy system ____(A)____ a great deal of fossil energy, which ____(B)____ our efforts to cut global emissions.

	(A)	(B)
①	requires	supports
②	avoids	weakens
③	avoids	supports
④	requires	weakens
⑤	reduces	weakens

For many centuries, people have imagined machines that could be smart and make decisions as humans do. There have been myths about robots, automatons, and artificial beings since ancient Greece (e.g., the myth of Pandora, who released ills upon the world). Likewise, literature throughout history has dreamed of creating human-like creatures and thinking machines (e.g., Mary Shelley's Frankenstein). In 1950, British mathematician Alan Turing asked whether machines could think and reason like humans and then developed the Turing test to measure a machine's intelligence and whether the machines can think autonomously. A few years later, MIT professor John McCarthy coined "artificial intelligence," replacing the previously used expression "automata studies." Since then, artificial intelligence has become the study and practice of "making intelligent machines" that are programmed to think like humans — endowed by their creators with reasoning and learning.

* automaton: 자동 장치 endow: 부여하다

① Literature has always warned people about the dangers of thinking machines.
② Ancient Greek myths about robots were the first cause of the Turing test.
③ Alan Turing built the first machine that could think like a human.
④ The idea of intelligent machines has a long history that led to artificial intelligence.
⑤ Machines can now make better decisions than humans in many fields.

24 다음 빈칸에 들어갈 말로 가장 적절한 것은?

③ work faster than humans
④ tell old myths to people
⑤ move like ancient robots

25 다음 글의 요지로 가장 적절한 것은?

The desert tortoise has an easy way to handle Death Valley's extreme heat: it keeps away from it. The slow-moving creature hibernates during the winter and stays in its tunnel for much of the summer, meaning that it spends more than 90 percent of its life immobile. In fact, the tortoise usually only surfaces after a good rain. Then, it gets to work. The tortoise stocks up on water by eating plants and digging holes to collect rain. But to stay supplied with water through its extended hibernation, the reptile relies on something else — its highly sophisticated bladder. Unlike most animals, the tortoise's bladder acts as a holding tank, allowing it to reabsorb water back into its body. Incredibly, a desert tortoise can go a full year without taking in any freshwater at all. And because its bladder is so important to a tortoise's survival, park rangers often remind visitors not to stop and help the slow-movers across the road. Tortoises become so terrified when people pick them up that they empty their bladders, losing their precious water reserves.

* hibernation: 동면 bladder: 방광

① Park rangers should help desert tortoises cross the road more often.
② Death Valley's extreme heat forces the desert tortoise to travel far to find water.
③ A tortoise can live a full year because it eats plants all through the summer.
④ The desert tortoise spends most of its life digging holes to collect rain.
⑤ The desert tortoise survives Death Valley's heat by avoiding it and by saving water in its bladder.

26 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

The desert tortoise has a simple way of ①coping with the extreme heat of Death Valley: It avoids it. The slow-moving creature hibernates during the winter and stays in its tunnel for much of the summer, meaning that it spends more than 90 percent of its life immobile. In fact, the tortoise usually only ②surface after a good rain. Then, it gets to work. The tortoise stocks up on water by ③eating plants and digging holes ④to collect rain. But to stay supplied with water through its extended hibernation, the reptile relies on something else — its highly sophisticated bladder. Unlike most animals, the tortoise's bladder acts as a holding tank, ⑤allowing it to reabsorb water back into its body. Incredibly, a desert tortoise can go a full year without taking in any freshwater at all. And because its bladder is so important to a tortoise's survival, park rangers often remind visitors not to stop and help the slow-movers across the road. Tortoises become so terrified when people pick them up that they empty their bladders, losing their precious water reserves.

Suppose you are riding your bicycle on a flat road. You stop pedalling: no force is now acting to move you forward. What happens? You gradually slow down. How could you slow down more suddenly, in a shorter distance? By putting the brakes on. Because the brakes change your movement, making you slow down more suddenly, they must be exerting a force on the bicycle and you, as they grip and rub on the wheel-rims. Friction is the name of a force that slows moving things down by pushing against the direction of their movement. Even without the brakes on, there are other friction forces acting on you and your bicycle, which also slow you down. One of these is friction in the wheels rubbing on the axles. Another is air resistance, which you can feel, pushing you backwards as you and the bicycle move forwards. When you apply these ideas to something around you, like a cart, you can see what could be generating friction: mainly the axles rubbing on the body as they rotate.

* axle: (바퀴의) 축 rim: 테두리

Friction is a ____(A)____ that works against movement, so it makes moving things ____(B)____.

	(A)	(B)
①	wheel	speed up
②	wheel	slow down
③	brake	speed up
④	force	speed up
⑤	force	slow down

28 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?

Think of yourself riding a bike on level ground. You stop pedalling: no force is now acting to move you forward. What happens? You gradually slow down. How could you slow down more suddenly, in a shorter distance? By putting the brakes on. Because the brakes change your movement, making you slow down more suddenly, they must be ①exerted a force on the bicycle and you, as they grip and rub on the wheel-rims. This is the force ②called friction, which tends to slow down moving things by ③acting in the direction opposite to movement, that is backwards. Even without the brakes on, there are other friction forces ④acting on you and your bicycle, which also slow you down. One of these is friction in the wheels rubbing on the axles. Another is air resistance, which you can feel, pushing you backwards as you and the bicycle move forwards. When you apply these ideas to something around you, like a cart, you can see what could be ⑤generating friction: mainly the axles rubbing on the body as they rotate.

Every editing system now is a nonlinear computer-based system that allows random access to any video shot or scene, so no fast forwarding or fast reversing is needed to find it. Nonlinear systems can create a range of special effects, such as slow motion, wipes and dissolves. Another highlight of a digital nonlinear system is its random access process that makes it easy for an editor to find desired shots or scenes without having to spend time fast forwarding or rewinding videotape. With nonlinear editing, shots or scenes can be easily added or removed anywhere in the program, and the computer adjusts the program length automatically. Linear editing was like composing a paper on a typewriter. If a mistake was made or new information needed to be added the whole piece had to be retyped. Nonlinear editing, on the other hand, is like using a word processing program. If a mistake is made, it is easily deleted and fixed with a few keystrokes, and new information can be added easily.

* linear: 선형의

① Word processing programs can add slow motion to a video.
② Nonlinear editing makes it easy to find and change video scenes.
③ Linear editing is still the best way to add special effects.
④ Fast forwarding a videotape saves a lot of time for editors.
⑤ Typing on a typewriter teaches editors to avoid mistakes.

A morally good person is one who does morally bad actions significantly less often than most and does morally good ones significantly more often than most. Not only her actions but also her intentions and motives matter when we judge a person. A morally good person must intend to do morally good actions and intend to avoid morally bad ones. A person who unintentionally prevents harm to others and does not harm them simply because things do not turn out as she intends is not morally good. Although this kind of situation generally occurs only in slapstick movies, it is worth mentioning to avoid the false impression that it is the actual consequences of a person's actions that count toward her being judged morally good or bad. But actual consequences are important. A person who always tries to prevent harm but never does, is not generally thought of as morally good. Of such a person, it may be said that she means well; but, contrary to Kant, _____ before she is regarded as morally good.

① no actions are needed
② most people must agree
③ some results are necessary
④ good intentions are enough
⑤ her motives must be hidden

In contrast, we would hardly picture a hammer seen from above, with its handle hidden behind its head.

Vision is influenced by our preconceptions about reality. (①) In viewing a scene, we establish unconscious hierarchies that reflect our functional relationship to objects and our momentary priorities. For example, when visualizing a hammer in our mind's eye, we tend to "see" it in profile or at some other "ready for use" angle. (②) Because of how we use objects, we expect to see them in certain ways, and this makes it hard to see "like a camera." (③) The camera, like the human eye, sees only shapes and colors. (④) It documents the world impartially through a lens that is similar to the eye. When we look at them carefully, photographs are often surprising because they don't interpret confusing details but simply serve them up to us with a mechanical indifference. (⑤) And because of their flatness, photographs often contain areas that appear as unrecognizable colors and shapes.

Vision is ① influenced by our preconceptions about reality. In viewing a scene, we establish unconscious hierarchies that reflect our functional relationship to objects and our momentary priorities. For example, when visualizing a hammer in our mind's eye, we ② rarely "see" it in profile or at some other "ready for use" angle. One would ③ probably not visualize a hammer as seen from the top so that the handle is hidden by the hammer's head. Since we know how objects work, we expect to see them in certain ways, and these expectations get in the way of seeing "like a camera." The camera, like the human eye, sees only ④ shapes and colors. It documents the world impartially through a lens that is similar to the eye. When we look at them carefully, photographs are often ⑤ surprising because they don't interpret confusing details but simply serve them up to us with a mechanical indifference. And because of their flatness, photographs often contain areas that appear as unrecognizable colors and shapes.

"May I help you?" is the worst thing a retail salesperson can say, since the words do not make the customer want to talk and push the customer to defend himself or herself. The four words usually draw out a negative response that ① stops cold a sales transaction. Examples of better questions to use when approaching customers are "Is there anything in particular that you are ②looking for?" and "Are you shopping for a gift?" If a fashion salesperson ③approached you with "May I help you?" chances are you would feel the salesperson didn't care. This line is a rote approach that is so ④ overusing by untrained and uninterested salespeople. In fact, most of us ⑤shudder in horror on hearing these words. The question itself tells customers that they are in some kind of trouble and need to be rescued. This almost always puts the customer on the defense. "No, thank you" is usually the immediate response, even if the customer is actually in need of assistance. The subconscious thought by the customer is often "I'm smart enough to figure out what I want, and I don't need your help!"

If customers feel pressured or cornered, then salespeople won't make any sales. The approach has to promote a comfortable environment that makes customers feel there is no rush. Furthermore, if customers just want to look around, they should feel that it is all right to do so. In situations where customers really do want to look around on their own, salespeople should give customers their business cards and keep themselves accessible in case customers have questions or concerns.

① Customers who need help should always say "May I help you?" to salespeople.
② Fashion salespeople ought to leave customers alone and never speak to them.
③ Retail salespeople should give their business cards to every customer who comes in.
④ Untrained salespeople make more sales when they ask customers many questions.
⑤ The question "May I help you?" is a poor way to greet customers because it puts them on the defensive.
