Many atoms in your body are nearly as old as the universe itself. When you breathe, for example, only some of the atoms that you inhale are exhaled in your next breath. The remaining atoms are taken into your body to become part of you, and they later leave your body by various means. The atoms that form your body are not yours; you are borrowing them for a while. We all share from the same atom pool because atoms forever travel around, within, and among us. Atoms cycle from person to person as we breathe and as our sweat is evaporated. We recycle atoms on a grand scale. The origin of the lightest atoms goes back to the origin of the universe, and most heavier atoms are older than the Sun and Earth. There are atoms in your body that have existed since the first moments of time, recycling throughout the universe among limitless forms, both nonliving and living. You are in charge of the atoms in your body only for the present time. There will be many who will follow you.

* evaporate: 증발시키다

① Atoms from the universe stay in one person for the whole of that person's life.
② Each person owns a fixed set of atoms that never leave the body.
③ People should be careful about which atoms they take into their bodies.
④ We only borrow the atoms in our bodies for a while, and others will use them after us.
⑤ The atoms we breathe in are always older than the ones we breathe out.

Gardening is, by itself, a great way to exercise your body. It involves a range of motions, from digging and planting to watering and harvesting. These activities help improve strength, flexibility, and endurance. You might not realize it, but small tasks like weeding or turning compost can burn many calories. Gardening is particularly beneficial for those who find traditional exercise challenging. It's a low-impact way to stay active and fit, making it accessible for people of all ages and physical abilities. Gardening is good for your mind as well as for your body. Tending to plants can be incredibly calming and meditative. It allows you to focus on the present moment, reducing stress and anxiety. The repetitive tasks involved in gardening can induce a state of mindfulness, similar to meditation. Studies have shown that spending time in nature, even in a small garden, can elevate mood, improve cognition, and reduce depression symptoms. The sense of accomplishment from watching your plants grow and thrive can also boost self-esteem and overall well-being.

* compost: 퇴비

① Gardening burns more calories than any other kind of exercise.
② People of all ages should grow plants to feel proud of their work.
③ Studies show that a small garden is better than any park for your mood.
④ Gardening is too hard for people who find traditional exercise challenging.
⑤ Gardening is a simple way to keep both your body and mind healthy.

People who are against animal experimentation often say that medicine is not the only reason fewer people die, and that many advances that helped human health did not come from animal experiments. Defenders of research have claimed that since there is a strong correlation between the practice of animal experimentation and medical advancement, the former caused the latter. Opponents of research reject this inference. After all, we have independent reasons to expect these phenomena to be correlated. Since the law prescribes that all new drugs, prosthetic devices, and surgical techniques be tried on animals before they are used in humans, we will subsequently find that all medical advances are correlated with prior experimentation on animals. As a result, the link between animal experimentation and medical discovery comes from legal necessity; it is not evidence that animal experimentation led to medical advances. Moreover, several influential physicians have offered historical evidence that animal experimentation has not been as responsible for biomedical discovery as defenders suggest. They claim that clinical discoveries played a more substantial role than animal researchers have led us to believe.

* prosthetic: 보철의

① Clinical discoveries have become less important as modern medicine has grown.
② The law should stop new drugs from being tried on animals before they are used in humans.
③ Modern medicine is the only reason that the death rate has fallen.
④ The link between animal experimentation and medical progress does not prove that animal experimentation caused that progress.
⑤ Defenders of research have shown that animal experimentation is the main cause of medical advances.

10 글의 흐름으로 보아, 주어진 문장이 들어가기에 가장 적절한 곳은?

After all, there are independent reasons for us to expect these two things to be correlated.

Many opponents of animal experimentation argue that not only is modern medicine not the only cause for the decline in mortality, many medical advances that did contribute to human health were not the result of animal experimentation. (①) Defenders of research have claimed that since there is a strong correlation between the practice of animal experimentation and medical advancement, the former caused the latter. (②) Opponents of research reject this inference. (③) Since the law prescribes that all new drugs, prosthetic devices, and surgical techniques be tried on animals before they are used in humans, we will subsequently find that all medical advances are correlated with prior experimentation on animals. (④) So the correlation between animal experimentation and medical discovery exists because of the law, and it does not show that animal experimentation led to medical advances. Moreover, several influential physicians have offered historical evidence that animal experimentation has not been as responsible for biomedical discovery as defenders suggest. (⑤) They claim that clinical discoveries played a more substantial role than animal researchers have led us to believe.

As a species that began when resources were limited and dangers were great, we naturally tend to share and cooperate, but this becomes complicated when we have plenty and outside dangers are few. When we have less, we tend to be more open to sharing what we have. Certain nomadic tribes don't have much, yet they are happy to share because it is in their interest to do so. If you happen upon them in your travels, they will open up their homes and give you their food and hospitality. It's not just because they are nice people; it's because their survival depends on sharing, for they know that they may be the travelers in need of food and shelter another day. Ironically, when we have more, we build bigger fences, use better security to keep people away, and want to share less. Our desire for more, combined with our decreased physical interaction with the "common folk," starts to create a disconnection or blindness to reality.

* nomadic: 유목의 hospitality: 환대

① People with strong security become more open to the people around them.
② People who have a lot are less likely to share than people who have little.
③ Our natural tendency to share grows stronger as dangers become fewer.
④ Nomadic tribes are happier than people who live behind big fences.
⑤ Sharing with others is the best way to keep ourselves safe from danger.

Uncertainty is hard for members of the public to understand because its importance is relative. Take, for example, the distance between Earth and the sun: 1.49597×10^8 km, as measured at one point during the year. This seems relatively precise; after all, using six significant digits means I know the distance to an accuracy of one part in a million or so. However, if the next digit is uncertain, that means the uncertainty in knowing the precise Earth-sun distance is larger than the distance between New York and Chicago! Whether or not the quoted number is "precise" therefore depends on what I'm intending to do with it. If I care only about what minute the sun will rise tomorrow, then the number quoted here is fine. If I want to send a satellite to orbit just above the sun, however, then I would need to know distances more accurately.

* significant digit: 유효 숫자

① How much uncertainty matters depends on the purpose we have in mind.
② The distance between Earth and the sun is larger than the distance between New York and Chicago.
③ Members of the public should avoid any number that has some uncertainty.
④ Using more significant digits always makes a number more precise for everyone.
⑤ Sending a satellite to orbit the sun is the best way to measure distances.

20 글의 흐름으로 보아, 주어진 문장이 들어가기에 가장 적절한 곳은?

This seems quite precise at first; after all, six significant digits means I know the distance to one part in a million or so.

One of the things that makes uncertainty difficult for members of the public to appreciate is that the significance of uncertainty is relative. (①) Take, for example, the distance between Earth and the sun: 1.49597×10^8 km, as measured at one point during the year. (②) However, if the next digit is uncertain, that means the uncertainty in knowing the precise Earth-sun distance is larger than the distance between New York and Chicago! The desert tortoise faces the extreme heat of Death Valley with a simple answer: it stays out of it. The slow-moving creature hibernates during the winter and stays in its tunnel for much of the summer, meaning that it spends more than 90 percent of its life immobile. In fact, the tortoise usually only surfaces after a good rain. Then, it gets to work. The tortoise stocks up on water by eating plants and digging holes to collect rain. But to stay supplied with water through its extended hibernation, the reptile relies on something else — its highly sophisticated bladder. Unlike most animals, the tortoise's bladder acts as a holding tank, allowing it to reabsorb water back into its body. Incredibly, a desert tortoise can go a full year without taking in any freshwater at all. And because its bladder is so important to a tortoise's survival, park rangers often remind visitors not to stop and help the slow-movers across the road. Tortoises become so terrified when people pick them up that they empty their bladders, losing their precious water reserves.

* hibernation: 동면 bladder: 방광

① Digging holes is the best way for animals to find water in Death Valley.
② Park rangers teach visitors how to help tortoises cross dangerous roads.
③ A desert tortoise stays alive by staying out of the heat and saving every drop of water.
④ Slow-moving animals need more water than fast ones in a hot desert.
⑤ A desert tortoise grows stronger every time it faces the summer heat.

27 다음 글의 주제로 가장 적절한 것은?

Picture yourself pedalling a bike on a flat road. You stop pedalling: no force is now acting to move you forward. What happens? You gradually slow down. How could you slow down more suddenly, in a shorter distance? By putting the brakes on. Because the brakes change your movement, making you slow down more suddenly, they must be exerting a force on the bicycle and you, as they grip and rub on the wheel-rims. The force that slows moving things down by pushing against their movement is known as friction. Even without the brakes on, there are other friction forces acting on you and your bicycle, which also slow you down. One of these is friction in the wheels rubbing on the axles. Another is air resistance, which you can feel, pushing you backwards as you and the bicycle move forwards. When you apply these ideas to something around you, like a cart, you can see what could be generating friction: mainly the axles rubbing on the body as they rotate.

* axle: (바퀴의) 축 rim: 테두리

① Friction is a force that acts against movement and slows things down.
② Brakes work best when a bicycle is moving on a flat road.
③ Air resistance is a stronger force than the friction in the wheels.
④ Pedalling harder is the best way to make a bicycle go forward.
⑤ A cart needs axles so that it can move forward more easily.

28 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은?

Imagine that you are cycling along a level road. You stop pedalling: no force is now acting to move you forward. What happens? You ①gradually slow down. How could you slow down more suddenly, in a shorter distance? By putting the brakes on. Because the brakes change your movement, making you slow down more ②slowly, they must be exerting a force on the bicycle and you, as they grip and rub on the wheel-rims. This is the force called friction, which tends to slow down moving things by acting in the direction ③opposite to movement, that is backwards. Even without the brakes on, there are other friction forces acting on you and your bicycle, which also slow you down. One of these is friction in the wheels rubbing on the axles. Another is air resistance, which you can feel, pushing you ④backwards as you and the bicycle move forwards. When you apply these ideas to something around you, like a cart, you can see what could be generating friction: ⑤mainly the axles rubbing on the body as they rotate.

Now every editing system is a nonlinear, computer-based one that lets editors reach any video shot or scene at random without winding the tape forward or back. Nonlinear systems can create a range of special effects, such as slow motion, wipes and dissolves. Another highlight of a digital nonlinear system is its random access process that makes it easy for an editor to find desired shots or scenes without having to spend time fast forwarding or rewinding videotape. With nonlinear editing, shots or scenes can be easily added or removed anywhere in the program, and the computer adjusts the program length automatically. Linear editing was like composing a paper on a typewriter. If a mistake was made or new information needed to be added the whole piece had to be retyped. Nonlinear editing, on the other hand, is like _____. If a mistake is made, it is easily deleted and fixed with a few keystrokes, and new information can be added easily.

* linear: 선형의

① writing a letter by hand
② composing a paper on a typewriter
③ fast forwarding a videotape
④ retyping a whole paper
⑤ using a word processing program

A morally good person is one who does morally bad actions significantly less often than most and does morally good ones significantly more often than most. When we judge a person, her intentions and motives count as well as her actions. A morally good person must intend to do morally good actions and intend to avoid morally bad ones. A person who unintentionally prevents harm to others and does not harm them simply because things do not turn out as she intends is not morally good. Although this kind of situation generally occurs only in slapstick movies, it is worth mentioning to avoid the false impression that it is the actual consequences of a person's actions that count toward her being judged morally good or bad. But actual consequences are important. A person who always tries to prevent harm but never does, is not generally thought of as morally good. Of such a person, we can say that she means well; but, unlike Kant, we think some results are needed before she is regarded as morally good.

① Only a person's results, not her motives, decide whether she is good.
② Slapstick movies show how people prevent harm to others by accident.
③ Doing morally bad actions less often than most is the only thing that counts.
④ Good intentions alone are enough to make a person morally good.
⑤ A person is judged morally good by both her intentions and her actual results.

What we see is shaped by the ideas we already have about the world. In viewing a scene, we establish unconscious hierarchies that reflect our functional relationship to objects and our momentary priorities. For example, when visualizing a hammer in our mind's eye, we tend to "see" it in profile or at some other "ready for use" angle. One would probably not visualize a hammer as seen from the top so that the handle is hidden by the hammer's head. Knowing how we use objects makes us expect to see them in set ways, and this makes it hard to see as a camera does. The camera, like the human eye, sees only shapes and colors. It documents the world impartially through a lens that is similar to the eye. When we look at them carefully, photographs are often surprising because they don't interpret confusing details but simply serve them up to us with a mechanical indifference. And because of their flatness, photographs often contain areas that appear as unrecognizable colors and shapes.

① Our expectations about objects shape the way we see the world.
② A hammer should be photographed from the top to show its handle.
③ Photographs are surprising because they hide confusing details from us.
④ Shapes and colors are easier to see when an object is flat.
⑤ A camera sees the world better than the human eye because it has a lens.

Retail salespeople should never start with “May I help you?” as it fails to get customers talking and makes them defensive. The four words usually draw out a negative response that stops cold a sales transaction. Examples of better questions to use when approaching customers are “Is there anything in particular that you are looking for?” and “Are you shopping for a gift?” If a fashion salesperson approached you with “May I help you?” chances are you would feel the salesperson didn’t care. This line is a rote approach that is so overused by untrained and uninterested salespeople. In fact, most of us shudder in horror on hearing these words. In fact, “May I help you?” suggests that a customer is in some kind of trouble and has to be saved. This almost always puts the customer on the defense. ——(A)——, “No, thank you” is usually the immediate response, even if the customer is actually in need of assistance. The subconscious thought by the customer is often “I’m smart enough to figure out what I want, and I don’t need your help!”

If customers feel pressured or cornered, then salespeople won’t make any sales. The approach has to promote a comfortable environment that makes customers feel there is no rush. ——(B)——, if customers just want to look around, they should feel that it is all right to do so. In situations where customers really do want to look around on their own, salespeople should give customers their business cards and keep themselves accessible in case customers have questions or concerns.

① Salespeople should follow customers around and offer help as often as they can.
② Giving customers a business card is the best way to make a sale.
③ Customers should answer “No, thank you” whenever a salesperson comes near them.
④ Customers who feel defensive are the ones who most need help from salespeople.
⑤ Salespeople should not greet customers with “May I help you?” but make them feel comfortable and free to look around.
