Teachers who are not efficient overlook how much the opening minutes of a class can do. Often, if students are quiet enough and if there are many pressing demands on a teacher's time at that moment, more than ten minutes can disappear before class starts. It's no wonder that students are late for class; they have little reason to be on time. You can use the first ten minutes to get your class off to a great start, or you can choose to waste this time. The first minutes set the tone for the rest of the class. If you are prepared for class and have taught your students an opening routine, they can use this brief time to make mental and emotional transitions from the last class or subject and prepare to focus on learning new material. In summary, an opening routine is a tool that lets you _____.

① teach new material without any break
② make students arrive before the bell rings
③ start your class in an effective way
④ cut ten minutes from the end of class
⑤ check which students are late for class

People have used tools for ages that let us perceive natural phenomena our senses miss. In some cases, this consists of simply amplifying signals that feed into our normal sensory inputs (e.g., telescopes can bring into clear view that which is too far away for our eyes to perceive on their own). Other instruments turn signals that we cannot perceive into ones that we can observe. Some of these take the form of expanding the reach of our current senses, such as creating visible images based on the ultraviolet spectrum of light or changing sounds that are normally outside the range of what human ears can hear into audible signals. Alternatively, some instruments measure properties for which we have no sensory capacity at all and change them into that which we can observe.

* amplifying: 확장하다(amplify) audible: 들을 수 있는

① Tools let us perceive what our senses cannot reach on their own.
② Telescopes make faraway things clear but cannot help us hear.
③ Sound and light are the only things that humans can sense.
④ People should trust their senses more than their instruments.
⑤ Our senses grow stronger the more often we use tools.

When danger comes from predators or humans, big mammalian herbivore species act in a number of different ways. Certain species are nervous and fast, and they are ready to run away instantly when they feel a threat. Other species are slower, less nervous, seek protection in herds, stand their ground when threatened, and don't run until necessary. Naturally, the nervous species are difficult to keep in captivity. If put into an enclosure, they are likely to panic, and either die of shock or hit themselves repeatedly to death against the fence in their attempts to escape. That's true, for example, of gazelles, which for thousands of years were the most frequently hunted game species in some parts of the Fertile Crescent. There is no mammal species that the first settled peoples of that area had more opportunity to domesticate than gazelles. But no gazelle species has ever been domesticated. Just imagine trying to herd an animal that runs away, blindly hits itself against walls, can leap up to nearly 30 feet, and can run at a speed of 50 miles per hour!

* herbivore: 초식동물 herd: 무리

① Big herbivores protect themselves by standing their ground in herds.
② Herd animals are easier to hunt than animals that run away fast.
③ Fences should be built higher to keep nervous animals from escaping.
④ Gazelles were the most important food for the first settled peoples.
⑤ Animals that are easily frightened by danger are hard to domesticate.

12 글의 흐름으로 보아, 주어진 문장이 들어가기에 가장 적절한 곳은?

But no gazelle species has ever been successfully domesticated.

Big herbivores that are mammals deal with danger from predators or humans in many different ways. Some species are nervous, fast, and programmed for instant flight when they perceive a threat. (①) Other species are slower, less nervous, seek protection in herds, stand their ground when threatened, and don't run until necessary. Naturally, the nervous species are difficult to keep in captivity. (②) If put into an enclosure, they are likely to panic, and either die of shock or hit themselves repeatedly to death against the fence in their attempts to escape. 15 다음 글의 요지로 가장 적절한 것은?

Whether we feel happy or sad, content or discontent, is not determined merely by each individual successive moment of life experience — a good thing happens and I'm happy, a bad thing happens and I'm sad. While our experiences affect our mood, we are not blown in a completely new direction by each gust of wind. As humans, we adjust — to new information and events both good and bad — and return to our personal default level of well-being. There will be highs and lows, but over time, like water seeking its own level, we are pulled toward our baseline — back up after bad news and back down after good. The euphoria of first love fades, and so does the despair of a break-up. This tendency is best seen with little kids and their toy joy: When they get what they've longed for, they believe they will be happy for the rest of their lives. And for the first few minutes of the rest of their lives, they are. In time, the kids — as adults do — get used to their new joy and go back to normal.

* euphoria: (극도의) 행복감

① Little kids believe that one good thing will make them happy for their whole lives, and they are right.
② Our mood goes back to its usual level over time, however good or bad an event is.
③ A bad thing blows us in a completely new direction, so we feel sad for a long time.
④ Adults feel more joy than little kids when they get what they have longed for.
⑤ Losing a first love is the best way to find our own level of well-being.

Although you may put off going to sleep in order to squeeze more activities into your day, eventually your need for sleep becomes overwhelming and you are forced to get some sleep. This daily drive for sleep appears to be due, in part, to a compound known as adenosine. This natural chemical builds up in your blood as time awake increases. While you sleep, your body breaks down the adenosine. Thus, this molecule may be what your body uses to keep track of lost sleep and to trigger sleep when needed. An accumulation of adenosine and other factors might explain why, after several nights of less than optimal amounts of sleep, you build up a sleep debt that you must make up by sleeping longer than normal. Because of such built-in molecular feedback, you can't become accustomed to getting less sleep than your body needs. Sooner or later, you will pay the price for lost sleep.

* compound: 화합물 accumulation: 축적

① Putting off sleep for activities is the best way to use your time wisely.
② Your blood needs more adenosine when you sleep longer than you should.
③ Sleeping longer than normal one night removes all of your sleep debt for the week.
④ Adenosine is one reason why our body cannot avoid needing sleep.
⑤ Adenosine in the blood makes it easy to stay awake for many nights.

Richard Heinberg, an American journalist, says that building renewable energy systems to stop global warming is one of the largest projects of change in human history. In addition to solar panels and wind turbines, we have to build an alternative transport infrastructure, farming procedures and industrial processes. This transformation cannot happen without fossil fuels. For instance, production of concrete structures and steel elements require amounts of energy that is only possible to produce with fossil energy. Production of solar panels requires scarce and expensive minerals which must be excavated, again requiring the use of fossil fuels. Thus, the harder we push towards a renewable energy system, the faster we have to use fossil energy for the construction process. This is not only expensive, but also an undermining factor for our efforts to cut global emissions. Heinberg remarks that the cost of building this new energy infrastructure is seldom counted in transition proposals, which tend to focus just on energy supply requirements.

* excavate: 발굴하다

① Solar panels and wind turbines will soon replace fossil fuels in every industry.
② Pushing harder for renewable energy will quickly cut global emissions.
③ Concrete and steel are the best materials for building a clean energy system.
④ Journalists should write more about the cost of energy supply in news reports.
⑤ The road to clean energy still depends on the fossil fuels we want to leave behind.

22 다음 글의 밑줄 친 부분 중, 문맥상 낱말의 쓰임이 적절하지 않은 것은?

Richard Heinberg, an American journalist, argues that in building the renewable energy infrastructure to stop global warming, we are actually involved in one of the greatest change projects in human history. In addition to solar panels and wind turbines, we have to build an alternative transport infrastructure, farming procedures and industrial processes. This change ①cannot be made without fossil fuels. For instance, production of concrete structures and steel elements require amounts of energy that is only possible to produce with fossil energy. Production of solar panels requires ②scarce and expensive minerals which must be excavated, again ③requiring the use of fossil fuels. Thus, the harder we push towards a renewable energy system, the ④less we have to use fossil energy for the construction process. Humans have long imagined machines that think and decide like people. There have been myths about robots, automatons, and artificial beings since ancient Greece (e.g., the myth of Pandora, who released ills upon the world). Likewise, literature throughout history has dreamed of creating human-like creatures and thinking machines (e.g., Mary Shelley's Frankenstein). In 1950, British mathematician Alan Turing asked whether machines could think and reason like humans and then developed the Turing test to measure a machine's intelligence and whether the machines can think autonomously. A few years later, MIT professor John McCarthy coined "artificial intelligence," replacing the previously used expression "automata studies." Since then, artificial intelligence has become the study and practice of "making intelligent machines" that are programmed to think like humans — endowed by their creators with reasoning and learning.

* automaton: 자동 장치 endow: 부여하다

① From ancient myths to Turing's test, the dream of thinking machines has shaped artificial intelligence.
② Writers like Mary Shelley taught scientists how to build intelligent machines.
③ Ancient Greek myths proved that robots would one day replace human workers.
④ Artificial intelligence replaced automata studies because the old name was too long.
⑤ Alan Turing's test showed that machines can already think like humans.

24 주어진 글 다음에 이어질 글의 순서로 가장 적절한 것은?

Because the brakes change your movement, making you slow down more suddenly, they must be exerting a force on the bicycle and you, as they grip and rub on the wheel-rims. This is the force called friction, which tends to slow down moving things by _____. Even without the brakes on, there are other friction forces acting on you and your bicycle, which also slow you down. One of these is friction in the wheels rubbing on the axles. Another is air resistance, which you can feel, pushing you backwards as you and the bicycle move forwards. When you apply these ideas to something around you, like a cart, you can see what could be generating friction: mainly the axles rubbing on the body as they rotate.

* axle: (바퀴의) 축 rim: 테두리

① keeping the wheels from rubbing
② acting against the direction of movement
③ staying away from moving things
④ acting in the same direction as movement
⑤ helping things move forward

These days, all editing systems are computer-based and nonlinear, so any video shot or scene can be reached directly, with no need to fast forward or fast reverse. Nonlinear systems can create a range of special effects, such as slow motion, wipes and dissolves. Another highlight of a digital nonlinear system is its random access process that makes it easy for an editor to find desired shots or scenes without having to spend time fast forwarding or rewinding videotape. With nonlinear editing, shots or scenes can be easily added or removed anywhere in the program, and the computer adjusts the program length automatically. Linear editing was like composing a paper on a typewriter. If a mistake was made or new information needed to be added the whole piece had to be retyped. Nonlinear editing, in contrast, works like a word processing program. If a mistake is made, it is easily deleted and fixed with a few keystrokes, and new information can be added easily.

* linear: 선형의

① Editors who use computers must learn to type as fast as they can.
② Nonlinear editing lets editors find scenes and fix mistakes quickly and easily.
③ A mistake in video editing means the whole program must be started again.
④ Video editors should use word processing programs to write their scripts.
⑤ Linear editing is more useful than nonlinear editing for special effects.

Today, editing is done only on nonlinear computer systems, where you can jump to any video shot or scene without fast forwarding or reversing. Nonlinear systems can create a range of special effects, such as slow motion, wipes and dissolves. Another highlight of a digital nonlinear system is its random access process that makes it easy for an editor to find desired shots or scenes without having to spend time fast forwarding or rewinding videotape. With nonlinear editing, shots or scenes can be easily added or removed anywhere in the program, and the computer adjusts the program length automatically. Linear editing was like composing a paper on a typewriter. If a mistake was made or new information needed to be added the whole piece had to be retyped. Nonlinear editing, on the other hand, is like using a word processing program. If a mistake is made, it is easily deleted and fixed with a few keystrokes, and new information can be added easily.

* linear: 선형의

With nonlinear editing, work is ____(A)____ because editors can ____(B)____ any scene directly and change it.

	(A)	(B)
①	easier	avoid
②	easier	reach
③	harder	avoid
④	slower	avoid
⑤	harder	reach

A morally good person is one ①who does morally bad actions significantly less often than most and does morally good ones significantly more often than most. Her intentions and motives, along with her actions, are important in judging a person. A morally good person must intend to do morally good actions and intend to avoid morally bad ones. A person who unintentionally prevents harm to others and does not harm them simply because things do not turn out as she ②intends is not morally good. Although this kind of situation generally occurs only in slapstick movies, it is worth ③mentioned to avoid the false impression ④that it is the actual consequences of a person's actions that count toward her being judged morally good or bad. But actual consequences are important. A person who always tries to prevent harm but never ⑤does, is not generally thought of as morally good. Of such a person, it may be said that she means well; but, contrary to Kant, some results are necessary before she is regarded as morally good.

Our preconceptions about reality have an effect on how we see. In viewing a scene, we establish unconscious hierarchies that reflect our functional relationship to objects and our momentary priorities. For example, when visualizing a hammer in our mind's eye, we tend to "see" it in profile or at some other "ready for use" angle. One would probably not visualize a hammer as seen from the top so that the handle is hidden by the hammer's head. The functional relationship we have with objects creates visual expectations that interfere with our ability to _____. The camera, like the human eye, sees only shapes and colors. It documents the world impartially through a lens that is similar to the eye. When we look at them carefully, photographs are often surprising because they don't interpret confusing details but simply serve them up to us with a mechanical indifference. And because of their flatness, photographs often contain areas that appear as unrecognizable colors and shapes.

① remember where we put objects
② use tools in a new way
③ see things as a camera does
④ take pictures of a hammer
⑤ pay attention to small details

The way we see is guided by what we already think about reality. In viewing a scene, we establish unconscious hierarchies that reflect our functional relationship to objects and our momentary priorities.

(A) The camera, like the human eye, sees only shapes and colors. It documents the world impartially through a lens that is similar to the eye.

(B) When we look at them carefully, photographs are often surprising because they don't interpret confusing details but simply serve them up to us with a mechanical indifference. And because of their flatness, photographs often contain areas that appear as unrecognizable colors and shapes.

(C) For example, when visualizing a hammer in our mind's eye, we tend to "see" it in profile or at some other "ready for use" angle. One would probably not visualize a hammer as seen from the top so that the handle is hidden by the hammer's head. Our way of using objects leads us to expect to see them in certain ways, so it is hard to see "like a camera."

[35~36] 다음 글을 읽고, 물음에 답하시오.

The four words “May I help you?” are the worst thing a retail salesperson can say, as the words do not invite customers to speak and make customers guard themselves. The four words usually draw out a negative response that stops cold a sales transaction. Examples of better questions to use when approaching customers are “Is there anything in particular that you are looking for?” and “Are you shopping for a gift?” If a fashion salesperson approached you with “May I help you?” chances are you would feel the salesperson didn’t care. This line is a rote approach that is so overused by untrained and uninterested salespeople. In fact, most of us shudder in horror on hearing these words. The very meaning of the question “May I help you?” implies that the customer is in trouble of some sort and needs rescuing. This almost always puts the customer on the defense. “No, thank you” is usually the immediate response, even if the customer is actually in need of assistance. The subconscious thought by the customer is often “I’m smart enough to figure out what I want, and I don’t need your help!”

If customers feel pressured or cornered, then salespeople won’t make any sales. The approach has to promote a comfortable environment that makes customers feel there is no rush. Furthermore, if customers just want to look around, they should feel that it is all right to do so. In situations where customers really do want to look around on their own, salespeople should give customers their business cards and keep themselves accessible in case customers have questions or concerns.

* shudder: 몸서리치다
