1 다음 글의 요지로 가장 적절한 것은?

Inefficient teachers do not realize how much power the first minutes of class can have. Often, if students are quiet enough and if there are many pressing demands on a teacher's time at that moment, more than ten minutes can disappear before class starts. It's no wonder that students are late for class; they have little reason to be on time. **(가)** 여러분은 수업을 훌륭하게 시작하는 데 첫 10분을 사용할 수 있다, or you can choose to waste this time. The first minutes set the tone for the rest of the class. If you are prepared for class and have taught your students an opening routine, they can use this brief time to make mental and emotional transitions from the last class or subject and prepare to focus on learning new material. In short, a set routine for the opening minutes helps your class start effectively.

① Students are late for class because teachers give too much homework.
② Teachers should use a set opening routine so that class starts effectively.
③ Teachers should spend the first ten minutes checking who is late.
④ Quiet students need more attention at the start of class than others.
⑤ Moving from one subject to another is the hardest part of a school day.

2 밑줄 친 the present caretaker of the atoms in your body가 다음 글에서 의미하는 바로 가장 적절한 것은?

Many atoms in your body are nearly as old as the universe itself. When you breathe, for example, only some of the atoms that you inhale are exhaled in your next breath. The remaining atoms **(a)** are taken into your body **(b)** become part of you, and they later leave your body by various means. The atoms that make up your body are not really yours; you just borrow them for a while. We all share from the same atom pool because atoms forever **(c)** travel around, within, and among us. Atoms cycle from person to person as we breathe and as our sweat is evaporated. Atoms are recycled on a very large scale. The origin of the lightest atoms goes back to the origin of the universe, and most heavier atoms are older than the Sun and Earth. There are atoms in your body that **(d)** has existed since the first moments of time, recycling throughout the universe among limitless forms, both nonliving and living. You're the present caretaker of the atoms in your body. There will be many **(e)** who will follow you.

*evaporate: 증발시키다

① someone who creates new atoms by breathing and sweating
② someone who owns the atoms that make up the universe
③ someone who keeps the same atoms throughout life
④ someone who protects the body from harmful atoms
⑤ someone who holds atoms only for a time before they move on to others

Gardening itself is an excellent kind of physical exercise. It involves a range of motions, from digging and planting to watering and harvesting. ① These activities help improve strength, flexibility, and endurance. ② You might not realize it, but small tasks like weeding or turning compost can burn many calories. ③ However, some plants need special soil and a lot of sunlight to grow well. ④ Gardening is particularly beneficial for those who find traditional exercise challenging. ⑤ It's a low-impact way to stay active and fit, making it accessible for people of all ages and physical abilities. In addition to physical health, gardening offers deep benefits for mental health. Tending to plants can be incredibly calming and meditative. It allows you to focus on the present moment, reducing stress and anxiety. The repetitive tasks involved in gardening can induce a state of mindfulness, similar to meditation. Studies have shown that spending time in nature, even in a small garden, can elevate mood, improve cognition, and reduce depression symptoms. The sense of accomplishment from watching your plants grow and thrive can also boost self-esteem and overall well-being.

*compost: 퇴비

④ 식물을 돌보는 일은 현재에 집중하게 해 스트레스를 줄여 준다.
⑤ 넓은 정원에서 보내는 시간만이 기분을 좋게 하는 것으로 나타났다.

5 다음 글의 주제로 가장 적절한 것은?

For centuries, humans have used tools that turn natural phenomena we cannot sense into something we can perceive. In some cases, this consists of simply amplifying signals that feed into our normal sensory inputs (e.g., telescopes can bring into clear view that which is too far away for our eyes to perceive on their own). Other instruments turn signals that we cannot perceive into ones that we can observe. Some of these take the form of expanding the reach of our current senses, such as creating visible images based on the ultraviolet spectrum of light or changing sounds that are normally outside the range of what human ears can hear into audible signals. Alternatively, some instruments measure properties for which we have no sensory capacity at all and change them into that which we can observe.

*amplify: 확장하다 **audible: 들을 수 있는

① Tools help humans perceive natural phenomena that lie beyond their senses.
② Telescopes are the most important tools for observing faraway objects.
③ Human senses are sharp enough to perceive most natural phenomena.
④ Ultraviolet light is harmful to human eyes and must be blocked.
⑤ Scientists should rely on their own senses rather than on instruments.

Many opponents of animal experimentation argue that not only is modern medicine not the only cause for the decline in mortality, many medical advances that did contribute to human health were not the result of animal experimentation. Defenders of research have claimed that since there is a strong correlation between the practice of animal experimentation and medical advancement, the former caused the latter. Opponents of research reject this inference. After all, we have independent reasons to expect these phenomena to be correlated. Since the law prescribes that all new drugs, prosthetic devices, and surgical techniques be tried on animals before they are used in humans, we will subsequently find that all medical advances are correlated with prior experimentation on animals. Consequently, the correlation between animal experimentation and medical discovery is the result of legal necessity, not evidence that animal experimentation led to medical advances. Moreover, several influential physicians have offered historical evidence that animal experimentation has not been as responsible for biomedical discovery as defenders suggest. They claim that clinical discoveries played a more substantial role than animal researchers have led us to believe.

*prosthetic: 보철의

Large mammalian herbivore species respond to danger from predators or humans in different ways. Some species are ① nervous, fast, and programmed for instant flight when they perceive a threat. Other species are ② faster, less nervous, seek protection in herds, stand their ground when threatened, and don't run until necessary. **(A)** _____, the nervous species are difficult to keep in captivity. If put into an enclosure, they are likely to ③ panic, and either die of shock or hit themselves repeatedly to death against the fence in their attempts to escape. That's true, for example, of gazelles, which for thousands of years were the most frequently ④ hunted game species in some parts of the Fertile Crescent. The first settled peoples of that area had more chance to domesticate gazelles than any other mammal species. **(B)** _____ no gazelle species has ever been domesticated. Just imagine trying to herd an animal that ⑤ runs away, blindly hits itself against walls, can leap up to nearly 30 feet, and can run at a speed of 50 miles per hour!

*herbivore: 초식동물 **herd: 무리

For a species ① born in a time when resources were limited and dangers were great, our natural tendency to share and cooperate is complicated when resources are plenty and outside dangers are few. When we have less, we are more willing to share what we have. Certain nomadic tribes don't have much, yet they are happy ② to share because it is in their interest to do so. If you happen upon them in your travels, they will open up their homes and ③ giving you their food and hospitality. It's not just because they are nice people; it's because their survival ④ depends on sharing, for they know that they may be the travelers in need of food and shelter another day. Ironically, the more we own, the higher our fences, the more advanced our security to keep people out and the less we want to share. Our desire for more, combined with our reduced physical interaction with the "common folk," ⑤ starts to create a disconnection or blindness to reality.

*nomadic: 유목의 **hospitality: 환대

① ② ③ ④ ⑤

11 다음 빈칸에 들어갈 말로 가장 적절한 것은?

Whether we feel happy or sad, content or discontent, is not determined merely by each individual successive moment of life experience—a good thing happens and I'm happy, a bad thing happens and I'm sad. While our experiences affect our mood, we are not blown in a completely new direction by each gust of wind. As humans, we adjust—to new information and events both good and bad—and _____. There will be highs and lows, but over time, like water seeking its own level, we are pulled toward our baseline—back up after bad news and back down after good. The euphoria of first love fades, and so does the despair of a break-up. This tendency is best seen with little kids and their toy joy: When they get what they've longed for, they believe they will be happy for the rest of their lives. And for the first few minutes of the rest of their lives, they are. But then the kids—like adults—adapt.

*euphoria: (극도의) 행복감

① keep moving toward greater and greater happiness
② remember every bad event more strongly than good ones
③ become more sensitive to each new experience
④ stay in the mood created by the most recent event
⑤ return to our personal default level of well-being

12 다음 빈칸에 들어갈 말로 가장 적절한 것은?

Although you may put off going to sleep in order to squeeze more activities into your day, eventually your need for sleep becomes overwhelming and you are forced to get some sleep. This daily drive for sleep appears to be due, in part, to a compound known as adenosine. This natural chemical builds up in your blood as time awake increases. While you sleep, your body breaks down the adenosine. Thus, this molecule may be what your body uses to keep track of lost sleep and to trigger sleep when needed. An accumulation of adenosine and other factors might explain why, after several nights of less than optimal amounts of sleep, you build up a sleep debt that you must make up by sleeping longer than normal. Because of such built-in molecular feedback, you can't _____. Eventually, a lack of sleep catches up with you.

*compound: 화합물 **accumulation: 축적

① become accustomed to getting less sleep than your body needs
② get rid of adenosine without sleeping at all
③ sleep longer than normal after several busy days
④ feel tired when adenosine builds up in your blood
⑤ put off going to sleep to do more activities

13 다음 빈칸에 들어갈 말로 가장 적절한 것은?

One reason members of the public find uncertainty hard to understand is that the importance of uncertainty is relative. Take, for example, the distance between Earth and the sun: 1.49597 x 10^8 km, as measured at one point during the year. This seems relatively precise; after all, using six significant digits means I know the distance to an accuracy of one part in a million or so. However, if the next digit is uncertain, that means the uncertainty in knowing the precise Earth-sun distance is larger than the distance between New York and Chicago! Whether or not the quoted number is "precise" therefore depends on _____. If I care only about what minute the sun will rise tomorrow, then the number quoted here is fine. If I want to send a satellite to orbit just above the sun, however, then I would need to know distances more accurately.

*significant digit: 유효 숫자

① how many significant digits it has
② what I'm intending to do with it
③ who measured it at that point in the year
④ how far New York is from Chicago
⑤ whether members of the public can understand it

14 다음 빈칸에 들어갈 말로 가장 적절한 것은?

Richard Heinberg, an American journalist, argues that in building the renewable energy infrastructure to stop global warming, we are actually involved in one of the greatest change projects in human history. In addition to solar panels and wind turbines, we have to build an alternative transport infrastructure, farming procedures and industrial processes. This transformation cannot happen without fossil fuels. For instance, production of concrete structures and steel elements require amounts of energy that is only possible to produce with fossil energy. Production of solar panels requires scarce and expensive minerals which must be excavated, again requiring the use of fossil fuels. Thus, the harder we push towards a renewable energy system, _____. This is not only expensive, but also an undermining factor for our efforts to cut global emissions. Heinberg remarks that the cost of building this new energy infrastructure is seldom counted in transition proposals, which tend to focus just on energy supply requirements.

*excavate: 발굴하다

① the less we need to depend on fossil fuels for any project
② the more quickly global emissions will fall to zero
③ the cheaper solar panels and wind turbines will become
④ the faster we have to use fossil energy for the construction process
⑤ the more journalists will support transition proposals

Humans for centuries have dreamed of machines that could become intelligent and make human-like decisions.

(A) There have been myths about robots, automatons, and artificial beings since ancient Greece (e.g., the myth of Pandora, who released ills upon the world). Likewise, literature throughout history has dreamed of creating human-like creatures and thinking machines (e.g., Mary Shelley's Frankenstein).

(B) A few years later, MIT professor John McCarthy coined "artificial intelligence," replacing the previously used expression "automata studies." Since then, artificial intelligence has become the study and practice of "making intelligent machines" that are programmed to think like humans—endowed by their creators with reasoning and learning.

(C) In 1950, British mathematician Alan Turing asked whether machines could think and reason like humans and then developed the Turing test to measure a machine's intelligence and whether the machines can think autonomously.

But to stay supplied with water through its extended hibernation, the reptile relies on something else—its highly sophisticated bladder.

The desert tortoise has a simple solution for coping with Death Valley's extreme heat: It avoids it. The slow-moving creature hibernates during the winter and stays in its tunnel for much of the summer, meaning that it spends more than 90 percent of its life immobile. In fact, the tortoise usually only surfaces after a good rain. (①) Then, it gets to work. (②) The tortoise stocks up on water by eating plants and digging holes to collect rain. (③) Unlike most animals, the tortoise's bladder acts as a holding tank, allowing it to reabsorb water back into its body. (④) Incredibly, a desert tortoise can go a full year without taking in any freshwater at all. (⑤) And because its bladder is so important to a tortoise's survival, park rangers often remind visitors not to stop and help the slow-movers across the road. Tortoises become so terrified when people pick them up that they empty their bladders, losing their precious water reserves.

*hibernation: 동면 **bladder: 방광

Imagine you are pedalling your bicycle on a level road. You stop pedalling: no force is now acting to move you forward. What happens? You gradually slow down.

(A) Even without the brakes on, there are other friction forces acting on you and your bicycle, which also slow you down. One of these is friction in the wheels rubbing on the axles. Another is air resistance, which you can feel, pushing you backwards as you and the bicycle move forwards.

(B) When you apply these ideas to something around you, like a cart, you can see what could be generating friction: mainly the axles rubbing on the body as they rotate.

(C) How could you slow down more suddenly, in a shorter distance? By putting the brakes on. Because the brakes change your movement, making you slow down more suddenly, they must be exerting a force on the bicycle and you, as they grip and rub on the wheel-rims. This force is known as friction, and it tends to slow moving things down by acting against their movement, that is, backwards.

*axle: (바퀴의) 축 **rim: 테두리

All editing systems are now nonlinear computer-based systems that allow random access to any video shot or scene without having to fast forward or fast reverse to find it. Nonlinear systems can create a range of special effects, such as slow motion, wipes and dissolves. Another highlight of a digital nonlinear system is its random access process that makes it easy for an editor to find desired shots or scenes without having to spend time fast forwarding or rewinding videotape. With nonlinear editing, shots or scenes can be easily added or removed anywhere in the program, and the computer adjusts the program length automatically. Linear editing was like composing a paper on a typewriter. If a mistake was made or new information needed to be added the whole piece had to be retyped. Nonlinear editing, on the other hand, is like using a word processing program. If a mistake is made, it is easily deleted and fixed with a few keystrokes, and new information can be added easily.

*linear: 선형의

↓

Unlike linear editing, nonlinear editing gives editors **(A)** _____ access to any shot or scene, so mistakes can be fixed and new information can be added **(B)** _____.

	(A)		**(B)**

But actual consequences are important.

A morally good person does morally bad actions far less often than most people and does morally good ones far more often than most. In judging a person not only her actions but also her intentions and motives are relevant. (①) A morally good person must intend to do morally good actions and intend to avoid morally bad ones. (②) A person who unintentionally prevents harm to others and does not harm them simply because things do not turn out as she intends is not morally good. (③) Although this kind of situation generally occurs only in slapstick movies, it is worth mentioning to avoid the false impression that it is the actual consequences of a person's actions that count toward her being judged morally good or bad. (④) A person who always tries to prevent harm but never does, is not generally thought of as morally good. (⑤) Of such a person, it may be said that she means well; but, contrary to Kant, some results are necessary before she is regarded as morally good.

Our preconceptions about reality influence the way we see. In ① viewing a scene, we establish unconscious hierarchies that reflect our functional relationship to objects and our momentary priorities. For example, when ② visualizing a hammer in our mind's eye, we tend to "see" it in profile or at some other "ready for use" angle. One would probably not visualize a hammer as seen from the top so that the handle ③ is hidden by the hammer's head. Because of our functional relationship with objects, we form visual expectations that interfere with our ability to see "like a camera." The camera, like the human eye, sees only shapes and colors. It documents the world impartially through a lens ④ that is similar to the eye. When we look at them carefully, photographs are often ⑤ surprised because they don't interpret confusing details but simply serve them up to us with a mechanical indifference. And because of their flatness, photographs often contain areas that appear as unrecognizable colors and shapes.

"May I help you?" are the worst four words that a retail salesperson can utter because they don't encourage the customer to talk and put **(a)** them on the defensive. The four words usually draw out a ① positive response that stops cold a sales transaction. Examples of better questions to use when approaching customers are "Is there anything in particular that you are looking for?" and "Are you shopping for a gift?" If a fashion salesperson approached **(b)** you with "May I help you?" chances are you would feel the salesperson didn't care. This line is a rote approach that is so ② overused by untrained and uninterested salespeople. In fact, most of us shudder in horror on hearing these words. The very meaning of the question "May I help you?" implies that the customer is in trouble of some sort and needs rescuing. This almost always puts the customer on the ③ defense. "No, thank you" is usually the immediate response, even if the customer is actually in need of assistance. The subconscious thought by the customer is often "**(c)** I'm smart enough to figure out what I want, and I don't need **(d)** your help!"

If customers feel ④ pressured or cornered, then salespeople won't make any sales. The approach has to promote a ⑤ comfortable environment that makes customers feel there is no rush. Furthermore, if customers just want to look around, **(e)** they should feel that it is all right to do so. In situations where customers really do want to look around on their own, salespeople should give customers their business cards and keep themselves accessible in case customers have questions or concerns.
