It's no wonder that students are late for class; they have little reason to be on time.

Inefficient teachers overlook the potential power of the opening minutes of class. (①) Often, if students are quiet enough and if there are many pressing demands on a teacher's time at that moment, more than ten minutes can disappear before class starts. (②) You can use the first ten minutes to get your class off to a great start, or you can choose to waste this time. (③) How you use the first minutes shapes the mood of the rest of the class. (④) If you are prepared for class and have taught your students an opening routine, they can use this brief time to make mental and emotional transitions from the last class or subject and prepare to focus on learning new material. (⑤) To sum up, you need an opening routine so that your class can begin effectively.

Many of the atoms in your body are almost as old as the universe itself. When you breathe, for example, only some of the atoms that you inhale are exhaled in your next breath. The remaining atoms are taken into your body to become part of you, and they later leave your body by various means.

(A) For now, you are only taking care of the atoms in your body. There will be many who will follow you.

(B) We recycle atoms on a grand scale. The origin of the lightest atoms goes back to the origin of the universe, and most heavier atoms are older than the Sun and Earth. There are atoms in your body that have existed since the first moments of time, recycling throughout the universe among limitless forms, both nonliving and living.

(C) You don't "own" the atoms that make up your body; you borrow them. We all share from the same atom pool because atoms forever travel around, within, and among us. Atoms cycle from person to person as we breathe and as our sweat is evaporated.

*evaporate: 증발시키다

The act of gardening itself is a fantastic form of physical activity. It involves a range of motions, from digging and planting to watering and harvesting. These activities help improve strength, flexibility, and endurance. You might not realize it, but small tasks like weeding or turning compost can burn many calories. Gardening is especially helpful for people who find regular exercise hard. It's a low-impact way to stay active and fit, making it accessible for people of all ages and physical abilities. Besides physical health, gardening has profound mental health benefits. Tending to plants can be incredibly calming and meditative. It allows you to focus on the present moment, reducing stress and anxiety. The repetitive tasks involved in gardening can induce a state of mindfulness, similar to meditation. Research shows that time spent in nature, even in a small garden, can lift mood, improve thinking, and ease symptoms of depression. The sense of accomplishment from watching your plants grow and thrive can also boost self-esteem and overall well-being.

*compost: 퇴비

For many centuries, humans have taken advantage of tools that translate and bring into our perception natural phenomena that we can't perceive with our senses. In some cases, this consists of simply amplifying signals that feed into our normal sensory inputs (e.g., telescopes can bring into clear view that which is too far away for our eyes to perceive on their own). Other instruments turn signals that we cannot perceive into ones that we can observe. Some of these take the form of expanding the reach of our current senses, such as creating visible images based on the ultraviolet spectrum of light or changing sounds that are normally outside the range of what human ears can hear into audible signals. Alternatively, some instruments measure properties that we cannot sense at all and turn them into something we can observe.

*amplify: 확장하다 **audible: 들을 수 있는

↓

Humans have long used tools that either **(A)** _____ signals our senses can already receive or **(B)** _____ signals we cannot perceive into ones we can observe.

	(A)		(B)
①	amplify	.....	hide
②	reduce	.....	turn

Many opponents of animal experimentation argue that not only is modern medicine not the only cause for the ① decline in mortality, many medical advances that did contribute to human health were not the result of animal experimentation. Defenders of research have claimed that since there is a ② strong correlation between the practice of animal experimentation and medical advancement, the former caused the latter. Opponents of research do not ③ accept this conclusion. After all, **(가)** 우리에게는 이 현상들이 상관관계가 있을 것이라고 예상할 독립적인 이유가 있다. Since the law prescribes that all new drugs, prosthetic devices, and surgical techniques be tried on animals before they are used in humans, we will subsequently find that all medical advances are correlated with ④ later experimentation on animals. Therefore, the link between animal experimentation and medical discovery comes from legal necessity, not from evidence that animal experimentation led to medical advances. Moreover, several influential physicians have offered historical evidence that animal experimentation has not been as responsible for biomedical discovery as defenders suggest. They claim that clinical discoveries played a more ⑤ substantial role than animal researchers have led us to believe.

6 주어진 글 다음에 이어질 글의 순서로 가장 적절한 것은?

Big mammalian herbivore species react to danger from predators or humans in different ways.

(A) That's true, for example, of gazelles, which for thousands of years were the most frequently hunted game species in some parts of the Fertile Crescent. There is no mammal species that the first settled peoples of that area had more opportunity to domesticate than gazelles. However, no gazelle species has ever been domesticated. Just imagine trying to herd an animal that runs away, blindly hits itself against walls, can leap up to nearly 30 feet, and can run at a speed of 50 miles per hour!

(B) Some species are nervous, fast, and programmed for instant flight when they perceive a threat. Other species are slower, less nervous, seek protection in herds, stand their ground when threatened, and don't run until necessary.

(C) Naturally, it is hard to keep the nervous species in captivity. If put into an enclosure, they are likely to panic, and either die of shock or hit themselves repeatedly to death against the fence in their attempts to escape.

*herbivore: 초식동물 **herd: 무리

① (A) - (C) - (B) ② (B) - (A) - (C) ③ (B) - (C) - (A)

7 다음 빈칸에 들어갈 말로 가장 적절한 것은?

Our natural tendency to share and cooperate, which developed in a time when resources were limited and dangers were great, becomes complicated when resources are plenty and outside dangers are few. When we have less, we tend to be _____. Certain nomadic tribes don't have much, yet they are happy to share because it is in their interest to do so. If you happen upon them in your travels, they will open up their homes and give you their food and hospitality. It's not just because they are nice people; it's because their survival depends on sharing, for they know that they may be the travelers in need of food and shelter another day. Ironically, the more we have, the bigger our fences, the more sophisticated our security to keep people away and the less we want to share. Our desire for more, together with our reduced physical contact with the "common folk," begins to create a disconnection or blindness to reality.

*nomadic: 유목의 **hospitality: 환대

① more open to sharing what we have
② less willing to help travelers in need
③ more interested in building bigger fences
④ more worried about our own security
⑤ less likely to trust nomadic tribes

8 밑줄 친 we are not blown in a completely new direction by each gust of wind가 다음 글에서 의미하는 바로 가장 적절한 것은?

Whether we feel happy or sad, content or discontent, **(a)** is not determined merely by each individual successive moment of life experience—a good thing happens and I'm happy, a bad thing happens and I'm sad. While our experiences **(b)** affects our mood, we are not blown in a completely new direction by each gust of wind. As humans, we adjust—to new information and events both good and bad—and return to our personal default level of well-being. There will be highs and lows, but over time, like water **(c)** seeking its own level, we are pulled toward our baseline—back up after bad news and back down after good. The joy of first love fades, and so does the pain of a break-up. This tendency is best seen with little kids and their toy joy: When they get **(d)** that they've longed for, they believe they **(e)** will be happy for the rest of their lives. And for the first few minutes of the rest of their lives, they are. But then the kids, just like adults, adapt.

① our mood changes completely with every new experience
② we should avoid going outside on windy days
③ good events affect us more strongly than bad ones
④ a single event does not completely change our overall mood
⑤ we can always choose the direction of our life

9 글의 흐름으로 보아, 주어진 문장이 들어가기에 가장 적절한 곳은?

While you sleep, your body breaks down the adenosine.

You may delay going to sleep to fit more activities into your day, but in the end your need for sleep becomes too strong and you are forced to sleep. (①) This daily drive for sleep appears to be due, in part, to a compound known as adenosine. This natural chemical builds up in your blood as time awake increases. (②) Thus, this molecule may be what your body uses to keep track of lost sleep and to trigger sleep when needed. (③) An accumulation of adenosine and other factors might explain why, after several nights of less than optimal amounts of sleep, you build up a sleep debt that you must make up by sleeping longer than normal. (④) Because of such built-in molecular feedback, you can't become accustomed to getting less sleep than your body needs. (⑤) Sooner or later, a lack of sleep catches up with you.

*compound: 화합물 **accumulation: 축적

One of the things that makes uncertainty difficult for members of the public to appreciate is that the significance of uncertainty is relative. Take, for example, the distance between Earth and the sun: 1.49597×10^8 km, as measured at one point during the year. This seems relatively precise; after all, using six significant digits means I know the distance to an accuracy of one part in a million or so. However, if the next digit is uncertain, that means the uncertainty in knowing the precise Earth-sun distance is larger than the distance between New York and Chicago! So, whether the quoted number is "precise" depends on how I plan to use it. If I care only about what minute the sun will rise tomorrow, then the number quoted here is fine. However, if I want to send a satellite to orbit just above the sun, I would need to know the distance more accurately.

*significant digit: 유효 숫자

① The distance between Earth and the sun changes greatly every minute.
② Six significant digits are always enough for scientific work.
③ Members of the public understand uncertainty better than scientists do.
④ Satellites cannot be sent to orbit close to the sun.
⑤ Whether a measurement counts as precise depends on its purpose.

Richard Heinberg, an American journalist, says that building renewable energy infrastructure to stop global warming is one of the greatest change projects in human history. In addition to solar panels and wind turbines, we have to build an alternative transport infrastructure, farming procedures and industrial processes. This transformation cannot happen without fossil fuels. **(A)** _____, production of concrete structures and steel elements require amounts of energy that is only possible to produce with fossil energy. Production of solar panels requires scarce and expensive minerals which must be excavated, again requiring the use of fossil fuels. **(B)** _____, the harder we push towards a renewable energy system, the faster we have to use fossil energy for the construction process. This is not only expensive, but also an undermining factor for our efforts to cut global emissions. According to Heinberg, transition proposals rarely count the cost of building this new energy infrastructure, as they tend to focus only on energy supply needs.

*excavate: 발굴하다

① For instance	.....	Thus
② In contrast	.....	Thus
③ For instance	.....	However
④ Otherwise	.....	Nevertheless
⑤ In contrast	.....	However

12 윗글의 요지로 가장 적절한 것은?

① Solar panels and wind turbines can be built without using any fossil energy.
② Journalists should write more articles about global warming.
③ Building a renewable energy system requires fossil fuels, which makes cutting emissions harder.
④ Farming procedures are the main cause of global emissions.
⑤ Renewable energy will soon be cheaper than fossil energy everywhere.

[13~14] 다음 글을 읽고, 물음에 답하시오.

Humans for centuries have dreamed of machines that ① could become intelligent and make human-like decisions. There have been myths about robots, automatons, and artificial beings since ancient Greece (e.g., the myth of Pandora, ② who released ills upon the world). Likewise, literature throughout history has dreamed of ③ creating human-like creatures and thinking machines (e.g., Mary Shelley's Frankenstein). In 1950, British mathematician Alan Turing asked whether machines could think and reason like humans and then developed the Turing test ④ to measure a machine's intelligence and whether the machines can think autonomously. A few years later, MIT professor John McCarthy coined "artificial intelligence," ⑤ replaced the previously used expression "automata studies." Since then, artificial intelligence has become the study and practice of "making intelligent machines" that are programmed to think like humans—endowed by their creators with reasoning and learning.

*automaton: 자동 장치 **endow: 부여하다

The desert tortoise has a simple solution for coping with Death Valley's extreme heat: **(a)** It avoids **(b)** it. The slow-moving creature hibernates during the winter and stays in **(c)** its tunnel for much of the summer, meaning that it spends more than 90 percent of its life immobile. In fact, the tortoise usually only surfaces after a good rain. Then, **(d)** it gets to work. The tortoise stocks up on water by eating plants and digging holes to collect rain. But to stay supplied with water through its extended hibernation, the reptile relies on something else—its highly sophisticated bladder. Unlike most animals, the tortoise's bladder acts as a holding tank, allowing **(e)** it to reabsorb water back into its body. Amazingly, a desert tortoise can survive a full year without drinking any freshwater. And since its bladder matters so much to a tortoise's survival, park rangers often tell visitors not to stop and help the slow-movers cross the road. Tortoises become so terrified when people pick them up that they empty their bladders, losing their precious water reserves.

*hibernation: 동면 **bladder: 방광

Imagine you are pedalling your bicycle on a level road. You stop pedalling: no force is now acting to move you forward. What happens? You ① gradually slow down. How could you slow down more suddenly, in a shorter distance? By putting the brakes on. Because the brakes change your movement, making you slow down more ② suddenly, they must be exerting a force on the bicycle and you, as they grip and rub on the wheel-rims. This is the force called friction, which tends to slow down moving things by acting in the direction ③ similar to movement, that is backwards. Even without the brakes on, there are other friction forces acting on you and your bicycle, which also slow you down. One of these is friction in the wheels rubbing on the axles. Another is air resistance, which you can feel, pushing you ④ backwards as you and the bicycle move forwards. When you apply these ideas to something around you, like a cart, you can see what could be generating friction: mainly the axles ⑤ rubbing on the body as they rotate.

*axle: (바퀴의) 축 **rim: 테두리

A morally good person is one who does morally bad actions significantly less often than most and does morally good ones significantly more often than most. In judging a person not only her actions but also her intentions and motives are relevant. A morally good person must intend to do morally good actions and to avoid morally bad ones. A person who unintentionally prevents harm to others and does not harm them simply because things do not turn out as she intends is not morally good. Although this kind of situation generally occurs only in slapstick movies, it is worth mentioning to avoid the false impression that it is the actual consequences of a person's actions that count toward her being judged morally good or bad. But actual consequences are important. A person who always tries to prevent harm but never succeeds is not usually seen as morally good. Of such a person, it may be said that she means well; but, contrary to Kant, _____ before she is regarded as morally good.

① good intentions alone are enough
② some results are necessary
③ her motives must be hidden from others
④ she has to appear in slapstick movies
⑤ bad actions must be completely avoided

21 다음 빈칸에 들어갈 말로 가장 적절한 것은?

Vision is influenced by our preconceptions about reality. When we view a scene, we set up unconscious hierarchies that reflect our functional relationship to objects and our priorities at the moment. For example, when visualizing a hammer in our mind's eye, we tend to "see" it in profile or at some other "ready for use" angle. One would probably not visualize a hammer as seen from the top so that the handle is hidden by the hammer's head. The functional relationship we have with objects creates visual expectations that _____. The camera, like the human eye, sees only shapes and colors. It documents the world impartially through a lens that is similar to the eye. When we look at them carefully, photographs are often surprising because they don't interpret confusing details but simply serve them up to us with a mechanical indifference. Also, because they are flat, photographs often have areas that look like colors and shapes we cannot recognize.

① help us notice every detail of a scene equally
② make photographs look less surprising to us
③ disappear when we picture objects in our mind's eye
④ allow us to document the world impartially
⑤ interfere with our ability to see "like a camera"

[22~23] 다음 글을 읽고, 물음에 답하시오.

"May I help you?" are the worst four words that a retail salesperson can utter because they don't encourage the customer to talk and put them on the defensive. The four words usually draw out a negative response that stops cold a sales transaction. Examples of better questions to use when approaching customers are "Is there anything in particular that you are looking for?" and "Are you shopping for a gift?" If a fashion salesperson greeted you with "May I help you?" you would probably feel the salesperson didn't care. This line is a rote approach that is so overused by untrained and uninterested salespeople. In fact, most of us shudder in horror on hearing these words. The very meaning of the question "May I help you?" implies that _____. This almost always puts the customer on the defense. "No, thank you" is usually the immediate response, even if the customer is actually in need of assistance. The subconscious thought by the customer is often "I'm smart enough to figure out what I want, and I don't need your help!"

If customers feel pressured or cornered, then salespeople won't make any sales. The approach must create a comfortable atmosphere in which customers feel there is no hurry. Furthermore, if customers just want to look around, they should feel that it is all right to do so. In situations where customers really do want to look around on their own, salespeople should give customers their business cards and keep themselves accessible in case customers have questions or concerns.

*shudder: 몸서리치다

22 윗글의 빈칸에 들어갈 말로 가장 적절한 것은?

① the salesperson is too busy to talk with the customer
